The exam is over the following sections from Chapters 1, 2, 3, and 4.

- Chapter 1, Section 1.1.
- Chapter 2, Sections 2.1, 2.2, and 2.4.
- Chapter 3, Sections 3.1, 3.2, and 3.3.
- Chapter 4, Sections 4.1, 4.2, 4.3, 4.4, 4.5, and 4.6.

You should also review all the code examples that we covered in class.

1. Suppose we have a class A which has a constructor that takes a single integer.
(a) After the following statements have been executed, how many A objects will exist (not counting garbage objects) and which objects are they? Explain your answer and include in your explanation a picture of Java's memory.
```
A a = new A(100);
A b = new A(150);
A c = b;
b = a;
a = null;
```

(b) After the following statements have been executed, how many A objects will exist (not counting garbage objects) and which objects are they? Explain your answer and include in your explanation a picture of Java's memory.

```
A a1 = new A(200);
A a2 = new A(250);
A a3 = a2;
a1 = null;
a2 = a1;
```

2. Consider this code that creates some Location objects:
```
Location a, b, c;
a = new Location(10,20);
b = new Location(10,20);
c = b;
```

After this code executes, what are the values of these boolean expressions?

```
a==b
a.equals(b)
a==c
a.equals(c)
b==c
b.equals(c)
```

Also, write two clear sentences that explain the difference between $==$ and the equals () method.
3. Consider this code that creates some Location objects:

```
Location a, b, c;
a = new Location(10,20);
b = (Location)a.clone( );
c = a;
c.shift(2,0);
```

After this code executes, what are the values of these boolean expressions?

```
a==b
a.equals(b)
a==c
a.equals(c)
b==c
b.equals(c)
```

4. Here is a simple Point and Circle class.
```
class Point class Circle
{ private double x, y;
    public Point(double x, double y)
    { this.x = x;
        this.y = y;
    }
    public double getX(){ return x; }
    public double getY(){ return y; }
}
```

```
{ private Point c; // center
```

{ private Point c; // center
private double r; // radius
private double r; // radius
public Circle(Point c, double r)
public Circle(Point c, double r)
{ this.r = r;
{ this.r = r;
this.c = c;
this.c = c;
}
}
// more stuff
// more stuff
}

```
}
```

(a) The constructor in Circle has a "privacy leak". Explain why.

Hint: Consider the following code.

```
Point p = new Point(1,2);
Circle c = new Circle(p, 10);
p.setX(100);
```

(b) Rewrite the Circle constructor to fix this problem.
5. What does the following program print out. Explain why.

```
class Thing
{ public int a;
    public int b;
    public Thing(int a, int b){this.a=a; this.b=b}
}
public class Test
{ public static void f(Thing x, int y)
    {
            x.a++;
            y++;
    }
    public static void main(String[] args)
    {
            Thing x = new Thing(1,1);
            int y = 1;
            f(x, y);
            System.out.println("x.a = " + x.a + " and x.b = " + x.b);
            System.out.println(" y = " + y);
    }
}
```

6. Suppose that we have classes A, B, C and D. Suppose that B is a subclass of A, that C is a subclass of $B$, and $D$ is a subclass of $A$. Suppose that we make the following declarations.

A a1 = new $A()$;
A a2 = new C();
D d1 = new $D()$;
For each part below, explain what, if any, errors would be caused by the statement in that part. Be sure to consider both compile time and run time errors.
(a) $\quad \mathrm{A}$ a3 $=$ new B() ;
(b) $\quad \mathrm{B}$ b1 $=$ new A() ;
(c) $\quad \mathrm{B}$ b2 $=(\mathrm{B}) \mathrm{a} 1$;
(d) $\quad \mathrm{B}$ b3 $=(\mathrm{B}) \mathrm{a} 2$;
(e) $\quad \mathrm{B}$ b4 $=(\mathrm{B}) \mathrm{d} 1$;
(f) $\quad \mathrm{B}$ b5 $=(\mathrm{C})(\mathrm{A})$ new D() ;
7. Suppose we implement the IntArrayBag class using two partially-filled, "parallel arrays" instead of a single (partially-filled) array. The first array, data, holds the values of the items in the bag and the second array, dataCounts, holds a count of the number of times that the associated item is in the bag. In other words, data[i] is an integer in the bag, and dataCounts [i] is the number of times that integer is in the bag.
We assume that there is an instance variable manyDataItems that tells us how many of the entries from the partially-filled arrays data and dataCounts are used to hold items from the bag (so manyDataItems <= data.length). The instance variable manyItems is a count of how many items are in the bag.
We assume that the part of the array data that stores the bag does not have any duplicate entries and we assume that each value in dataCounts is strictly greater than zero for all elements with index less than manyDataItems.
(a) Describe what is meant by the "capacity" of a bag in this implementation.
(b) Describe an advantage that this implementation of IntArrayBag has over the single array implementation from the textbook.
(c) Describe a disadvantage that this implementation of IntArrayBag has when compared to the single array implementation from the textbook.
(d) Write an implementation for each of the add (int element) and remove (int target) methods (see the next page).

```
public class IntArrayBag
{ // Use two partially-filled parallel arrays.
    private int[ ] data; // the data items
    private int[ ] dataCounts; // how many times each item is in this bag
    private int manyDataItems; // number of elements in partially-filled array
    private int manyItems; // total number of items in this bag
    public IntArrayBag( )
    { final int INITIAL_CAPACITY = 10;
        data = new int[INITIAL_CAPACITY];
        dataCounts = new int[INITIAL_CAPACITY];
        manyDataItems = 0;
        manyItems = 0;
    }
    public IntArrayBag(int initialCapacity)
    { if (initialCapacity < 0) throw new IllegalArgumentException("Capacity<0");
        data = new int[initialCapacity];
        dataCounts = new int[initialCapacity];
        manyDataItems = 0;
        manyItems = 0;
    }
```

/** Add a new element to this bag. If the new element would take this bag beyond its current capacity, then the capacity is increased. */ public void add(int element)
\{
\}//add()
/** Remove one copy of a specified element from this bag. If target was found in the bag, then one copy of target has been removed and the method returns true. Otherwise the bag remains unchanged and the method returns false. */ public boolean remove(int target)
\{
\}//remove()
\}//IntArrayBag
8. Here is part of the definition for a LinkedList class.

```
class LinkedList
{
    private ListNode head;
    private int size;
    public LinkedList()
    {
            this.head = null;
            this.size = 0;
    }
    // a private class
    class ListNode
    {
            public int item; // An item in the list.
            public ListNode next; // Reference to next item in the list.
    }
    // LinkedList methods...
}
```

(a) Write a method
public void add ( int element )
that adds a new node at the head of the linked list. (Notice that the inner class
ListNode only has a default constructor.)
(b) Write a method public int remove( )
that removes from the linked list the node at the head of the list and returns the int that was stored in that node. Throw an exception if the linked list is empty.
(c) Explain how you would modify the add method so that the following two lines of code will compile and run correctly.

LinkedList list = new LinkedList(); list.add(3).add(2).add(5, 6, 7).add(0).add(8);
9. On the last page of these review problems is an implementation of the IntNode class.
(a) Write an implementation of the static method
public static int countZeros( IntNode node )
that will count the number of zeros that occur in the given linked list of ints.
(b) Write an implementation of a static method public static String list2String( IntNode node )
that returns a String representation of the linked list referred to by the parameter node. If the linked list is empty, the String representation should be " []" (two square brackets next to each other). If the linked list is not empty, the String representation should look like this, "[ $\left.\begin{array}{llllll}3 & 5 & 0 & 2 & -4 & 16\end{array}\right]$ ", with a space before and after each entry of the list.
(c) Write a method
public static IntNode removeFirst( IntNode head)
that returns a reference to the second node from the linked list referred to by the parameter head.
(d) Write a method
public static IntNode addFirst( int element, IntNode head )
that returns a reference to the new head of a linked list with a node containing element followed by the list referred to by the parameter head.
(e) Write a method
public static void set( int element, int i, IntNode head ) that modifies the list referred to by the parameter head so that the i'th node in the list has its data changed to element. If there is no i'th node in the list, then the list is not modified.
10. Once again using the IntNode class, consider the following three lines of code.

IntNode head $=$ new $\operatorname{IntNode(4,new~IntNode(7,~new~IntNode(5,~new~IntNode(3,null))));~}$
IntNode ptr = head.getLink().getLink();
head.getLink().setLink( new IntNode(22, null) );
(a) Draw a picture of Java's memory after the first line above has been executed. Be sure to include what data is in each node.
(b) Draw a picture of Java's memory after the first and second lines above have been executed.
(c) Draw a picture of Java's memory after all three lines above have been executed.
(d) What would be a String representation for the linked list referred to by head?
(e) What would be a String representation for the linked list referred to by ptr?
(f) What would be a String representation for the linked list referred to by ptr after executing the following line (which would be executed after the above three lines)? ptr.getLink().setLink( head.getLink() );
11. (a) In the class name IntArrayBag, explain the significance of each part of the name: int, array, and bag.
(b) In the class name IntArraySeq, explain the significance of each part of the name: int, array, and seq.
(c) In the class name DoubleLinkedBag, explain the significance of each part of the name: double, linked, and bag.
12. Let A be an array of size $n \geq 2$ containing integers from 1 to $n-1$, inclusive, with exactly one number repeated.
(a) Write a method
public static int findRepeatedNumber (int[] A) that returns the value of the repeated number in the array A .
(b) Rewrite the method so that it uses just a single loop. (Hint: Make use of another array.)
13. Suppose that a Sequence ADT has the following interface.

```
public interface Sequence
{ public int size(); // Return number of elements in sequence.
    public void addFirst(int e); // Insert e at the front of the sequence.
    public void addLast(int e); // Insert e at the back of the sequence.
    // Inserts an element e to be at index i.
    public void add(int i, int e) throws IndexOutOfBoundsException;
    // Returns the element at index i, without removing it.
    public int get(int i) throws IndexOutOfBoundsException;
    // Removes and returns the element at index i.
    public int remove(int i) throws IndexOutOfBoundsException;
}
```

Starting with an empty sequence A, below each operation write down what the (cumulative) contents of the list would be after performing the operation. (Write the contents of the sequence as a horizontal, comma separated, list of numbers with the index 0 element on the left.)
A.add (0, 4)
A.add (0, 3)
A.addFirst(2)
A.addLast(7)
A.add (2, 1)
A.add(1, 4)
A.add(1, 5)
A.add (3, 2)
14. Below is an outline of a class that implements a linked list of integer nodes with two sentinel nodes (see pages 240-241 of the textbook).
(a) Draw a picture of the empty list created by the default constructor.
(b) Write an implementation for the addFirst() method.
(c) Write an implementation for the removeFirst() method that assumes the list is not empty.

```
public class IntLinkedList
{ IntNode head;
    IntNode tail;
    int manyItems;
    public IntLinkedList() // Create an empty list,
    { tail = new IntNode(0, null); // with two sentinel nodes.
        head = new IntNode(0, tail);
        manyItems = 0;
    }
```

    /** Add a new node to the beginning of the list. */
    public void addFirst (int \(n\) )
    \{
    \}
    /** Remove the first node from a nonempty list and return its data. */
    public int removeFirst()
    \{
    \}
    \}//IntLinkedList

```
class IntNode
{
    private int data;
    private IntNode link;
    public IntNode(int data, IntNode link)
    {
        this.data = data;
        this.link = link;
    }
    public int getData( ) { return data; }
    public IntNode getLink( ) { return link; }
    public void setData(int data) { this.data = data; }
    public void setLink(IntNode link) { this.link = link; }
}//IntNode
```
